

DATABASE SOP (SIMPLE)

This is the standard way to work with this project.

1) Normal deploy (daily use)

Use this when you changed code and want it live.

```
cd /Users/rayyanasim/Documents/usoap_tracker
git add -A
git commit -m "your message"
git push origin main
```

What happens on deploy:

? schema updates run

? app builds

? live submissions stay as they are

2) Update static PQ data (only when source sheet changed)

Use this when ICAO/reference fields changed (question text, guidance, ATC mapping, etc.).

```
cd /Users/rayyanasim/Documents/usoap_tracker
npm run db:seed:static
npm run db:check:atc
```

3) Copy Vercel production data to local (one command)

Use this when you want local to match what is on Vercel.

```
cd /Users/rayyanasim/Documents/usoap_tracker
npm run db:sync:prod-to-local
```

Then run:

```
npm run dev:clone
```

3b) Copy Vercel production data into your main local DB

Use this only if you want your normal local DB (usop) to become the same as Vercel production.

```
cd /Users/rayyanasim/Documents/usop_tracker
npm run db:sync:prod-to-local:main
```

The command asks for confirmation because it overwrites local DB data.

Then run:

```
npm run dev
```

4) Everyday local run

If you want your normal local database:

```
npm run dev
```

If you want the local copy of Vercel data:

```
npm run dev:clone
```

5) Important rules

- ? Do not run reset commands on production by accident.
- ? Do not mix multiple dev servers on different ports when checking data.
- ? If something looks wrong, run:

```
npm run db:check:atc
```

If this check says 0 ATC rows, run `npm run db:seed:static`.
